

DATA TAGGING: HOW TO TURN TREASURY TRANSACTIONS INTO INSIGHTS

PRISCILA NAGALLI

WHY DATA TAGGING MATTERS

Treasury processes thousands of transactions daily; payments, FX, funding, investments.

But if these transactions aren't tagged and classified, they're just movement not intelligence.

Tagging turns raw financial activity into structured, comparable, and analyzable information.

THE REALITY TODAY

- 60% of treasury teams still rely on manual data mapping for reporting.
- Data in ERPs, TMS, and bank statements often use inconsistent naming and chart-of-account logic.
- As a result, cash positions, exposures, and forecasts often misalign across entities.

WHAT “DATA TAGGING” MEANS IN TREASURY

Data tagging = attaching metadata (descriptive labels) to every transaction or balance to identify:

- Entity / Business Unit
- Country / Region
- Counterparty / Customer / Vendor
- Currency / Account
- Flow Type (Operational, Intercompany, FX, Debt, Investment)
- Cash Flow Category (Inflows / Outflows / Financing / Investing)

Each tag connects the “what” and “why” behind a transaction not just the “when” and “how much.”

PRISCILA NAGALLI

WHY TAGGING CHANGES EVERYTHING

When data is consistently tagged:

- Cash forecasts improve (you know which flows are recurring vs. one-off).
- FX exposures are traceable by business unit or region.
- Liquidity reports become dynamic no more manual reclassification.
- Audit and compliance reviews are faster, cleaner, and traceable.

Tagging turns activity into insight.

HOW TAGGING WORKS IN PRACTICE

Here's how world-class treasuries structure tagging:

Define a tag taxonomy — agree on categories (region, business unit, currency, flow type).

Standardize sources — enforce tagging at data entry (ERP, TMS, etc).

Automate enrichment — use rules to apply tags automatically based on transaction logic.

Validate integrity — audit tags monthly for missing or inconsistent values.

Integrate — make tags visible in dashboards and reporting layers.

TREASURY USE CASES

- Cash Forecasting: Identify inflows/outflows by region and frequency → higher forecast accuracy.
- Liquidity Optimization: Tag idle cash by entity to inform pooling and funding.
- Intercompany Netting: Tag flows to eliminate duplicate settlements.
- Bank Fee Analysis: Tag bank accounts by cost center for transparency.
- FX Risk Management: Tag exposures by transaction type for hedging precision.

This is how tagging moves treasury from reactive to proactive.

5 STEPS TO LAUNCH A TREASURY DATA TAGGING PROGRAM

- Audit your current data landscape — where does untagged data live?
- Define your tagging framework — align with business units, entities, and cash categories.
- Automate tagging in TMS/ERP — rules-based or AI-assisted tagging.
- Integrate with dashboards — visualize cash by tag dimension.
- Track KPIs — % tagged data, reconciliation time, forecast variance.

Within months, you'll shift from data collection to data intelligence.

KEY TAKEAWAYS

Data tagging isn't a technical exercise but it's a strategic discipline.

It's how modern treasury teams connect dots, build trust in data, and lead transformation with clarity.

Tag your transactions.
Find your insights.
Run your treasury with intelligence.
